Focusing on the increased interplay of theoretical advances in nonlinear hyperbolic systems, completely integrable systems, and evolutionary systems of nonlinear partial differential equations, this title contains papers grouped in sections: integrable systems, hyperbolic systems, variational problems, evolutionary systems, and dispersive systems.

These two volumes of 47 papers focus on the increased interplay of theoretical advances in nonlinear hyperbolic systems, completely integrable systems, and evolutionary systems of nonlinear partial differential equations. The papers both survey recent results and indicate future research trends in these vital and rapidly developing branches of PDEs. The editor has grouped the papers loosely into the following five sections: integrable systems, hyperbolic systems, variational problems, evolutionary systems, and dispersive systems. However, the variety of the subjects discussed, as well as their many interwoven trends, demonstrate that it is through interactive advances that such rapid progress has occurred. These papers require a good background in partial differential equations; many of the contributors are mathematical physicists, and the papers are addressed to mathematical physicists, particularly in perturbed integrable systems, as well as to PDE specialists and applied mathematicians in general.

*Modelling with Differential Equations in Chemical Engineering* covers the modelling of rate processes of engineering in terms of differential equations. While it includes the purely mathematical aspects of the solution of differential equations, the main emphasis is on the derivation and solution of major equations of engineering and applied science. Methods of solving differential equations by analytical and numerical means are presented in detail, with many solved examples and problems for solution by the reader.

emphasis is placed on numerical and computer methods of solution a key chapter in the book is devoted to the principles of mathematical modelling these principles are applied to the equations in important engineering areas the major disciplines covered are thermodynamics diffusion and mass transfer heat transfer fluid dynamics chemical reactions and automatic control these topics are of particular value to chemical engineers but also are of interest to mechanical civil and environmental engineers as well as applied scientists the material is also suitable for undergraduate and beginning graduate students as well as for review by practising engineers

the author uses mathematical techniques along with observations and experiments to give an in depth look at models for mechanical vibrations population dynamics and traffic flow equal emphasis is placed on the mathematical formulation of the problem and the interpretation of the results in the sections on mechanical vibrations and population dynamics the author emphasizes the nonlinear aspects of ordinary differential equations and develops the concepts of equilibrium solutions and their stability he introduces phase plane methods for the nonlinear pendulum and for predator prey and competing species models haberman develops the method of characteristics to analyze the nonlinear partial differential equations that describe traffic flow fan shaped characteristics describe the traffic situation that occurs when a traffic light turns green and shock waves describe the effects of a red light or traffic accident although it was written over 20 years ago this book is still relevant it is intended as an introduction to applied mathematics but can be used for undergraduate courses in mathematical modeling or nonlinear dynamical systems or to supplement courses in ordinary or partial differential equations
